## OpenAPI definition vo OAS 3.1

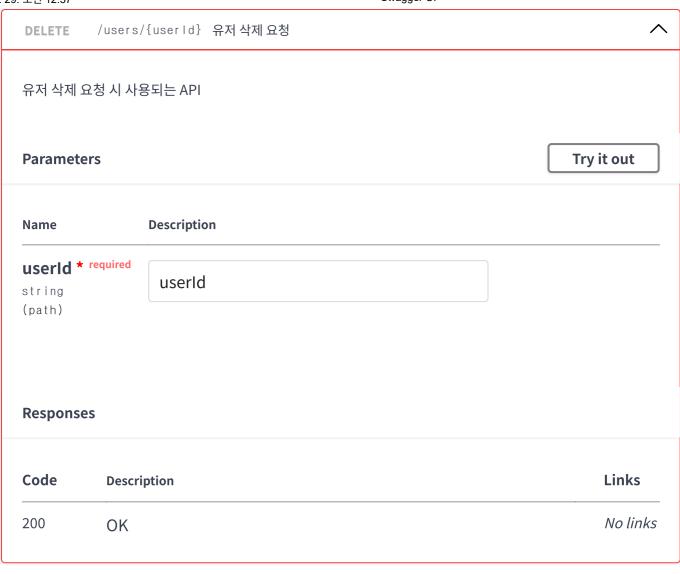

/v3/api-docs

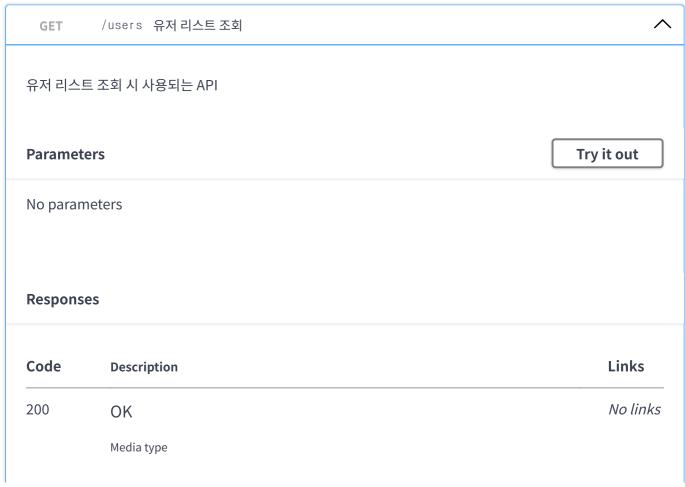

Servers

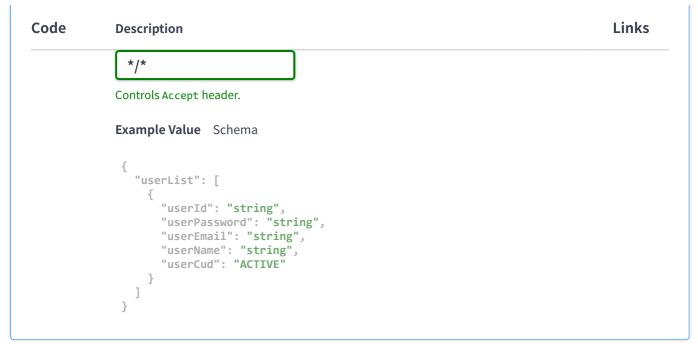

http://localhost:7070 - Generated server url

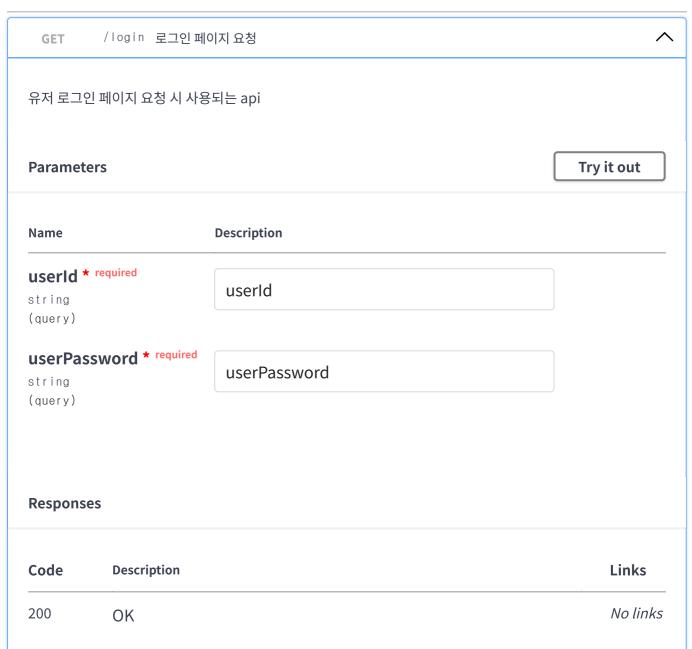

```
Code
                                                                                                      Links
              Description
              Controls Accept header.
              Example Value Schema
                  "userId": "string",
                  "userPassword": "string",
                 "userEmail": "string",
"userName": "string",
"userCud": "ACTIVE"
             /users/{userld} 유저 업데이트 요청
  PUT
유저 업데이트 요청 시 사용되는 API
                                                                                                 Try it out
Parameters
                      Description
Name
userId * required
                        userId
string
(path)
Request body required
                                                                                  application/json
Example Value Schema
   "userId": "string",
  "userPassword": "string",
"userEmail": "string",
"userName": "string"
Responses
Code
              Description
                                                                                                      Links
                                                                                                      No links
200
               OK
```

## login-controller

```
/login 로그인 요청
 POST
유저 로그인 요청 시 사용되는 api
                                                                                     Try it out
Parameters
No parameters
Request body required
                                                                        application/json
Example Value Schema
  "userId": "string",
  "userPassword": "string",
  "userEmail": "string",
"userName": "string"
Responses
                                                                                          Links
Code
             Description
                                                                                          No links
200
             OK
             Media type
             Controls Accept header.
             Example Value Schema
               "httpStatus": "100 CONTINUE",
                "responseMessage": "string"
```

## Schemas CreateUserRequest > Expand all object

ResponseDTO > Expand all object

User > Expandall object

**UserListResponseDTO** > Expand all object

UserResponseDTO > Expandall object
